

A brand-new user, before any trip exists. Instead of a blank screen, the app leads with what it does and one obvious way to begin. Planning never waits on a sign-up — work saves locally on the device immediately; an account is offered later only to sync across devices.

KEY FUNCTIONS

- One primary action: New trip
- Five goal starters (flattest, climbing, low-traffic, fewest-turns, art/history) seed a plan in a click
- Local-first — no account required to plan
- Header states plainly where work is saved

The same zero-state on the phone, in the high-contrast Outdoor theme. A compact value proposition, goal chips, and a thumb-friendly New trip button pinned at the bottom.

KEY FUNCTIONS

- Thumb-zone New trip button
- Goal chips seed a themed plan
- Local-first; sign in later to sync

Where saved tours and their route variants live.

Trips are searchable and filterable by goal; each card shows the route shape, distance and days — and, crucially, an honest sync state so the rider always knows whether a trip is only on this device or backed up to their account.

KEY FUNCTIONS

- Filter by theme, search by name
- Cards show map preview, stats, variant count
- Sync state per trip: Synced vs This device
- Start a New trip from the rail

The library on the phone. The same information model — theme, stats, variant and sync badges — as scrollable cards, with search on top and New trip pinned in the thumb zone.

KEY FUNCTIONS

- Scrollable trip cards with theme + sync badges
- Search
- Offline availability shown per trip

A guest has been planning locally. A calm, non-blocking banner explains why an account helps — sync across devices and recover the trips if this device is lost — and offers it without ever gating planning. The local trips sit right below, all clearly marked as living on this device.

KEY FUNCTIONS

- Non-blocking banner — planning is never gated
- Explains the benefit: sync + recovery
- Create account or Not now / dismiss
- Local trips remain fully usable, badged “This device”

The same account prompt on the phone, as a dismissible card at the top of the local library. Clear benefit, one primary action, and an easy way out.

KEY FUNCTIONS

- Dismissible card atop the library
- Create an account — one action
- Local trips intact below, marked “This device”

Comparing route alternatives

The heart of the product. When the planner changes a goal on part of a route — here asking for climbing and gravel across miles 18–34 — the app proposes a new line without discarding the current one. Both routes stay on one map (current “Route A” as a ghost, proposed “Route B” bold) with a side-by-side comparison. Nothing is committed until the planner decides.

KEY FUNCTIONS

- Both routes on one map: ghost = current, bold = proposed
- Overlaid elevation for the affected segment
- Compare card: distance, climbing, surface, traffic, time, day total — with deltas
- Decide: take B, keep A, or save B as a variant

After saving an alternative, the planner returns to the whole-tour view. The day still runs its active route — nothing was committed — but now carries a variant marker. Expanding it shows the active route against the saved option with their deltas, so the planner can flip the active line or keep collecting options before deciding.

KEY FUNCTIONS

- Day card marked with a stacked variant tab
- Expand to compare active route vs saved variant
- “Make active” re-draws the map and updates day totals
- Variants travel with the trip; totals unchanged until made active

The honest planning dead-end. When the routing engine can't satisfy every constraint at once, it never shows a raw error — it names exactly which constraints conflict on the stretch, then offers the nearest fixes with their trade-offs, so the planner can move forward with one click or adjust manually.

KEY FUNCTIONS

- Names the specific conflicting constraints
- Nearest fixes, each with its trade-off
- One-click apply, or adjust constraints manually
- Map shows where the route breaks

The screenshot displays the 'Blue Ridge Tour' interface for 'Day 2 · re-routing'. The map shows a route that ends in a dashed line and a red circle, indicating a break. A text box on the map states 'No through-route with all constraints on'. To the right, a panel titled 'Can't route Day 2 with every constraint' explains the conflict: 'These three pull against each other on this stretch — there's no road that satisfies all of them at once:'. The conflicting constraints are listed as:

- Lowest traffic (conflicts)
- Paved only (conflicts)
- Under 55 mi (conflicts)

Below these, the 'NEAREST FIXES' are provided:

- Allow a 4 mi gravel stretch**
Keeps traffic + mileage · one unpaved segment
- Raise the day cap to 61 mi**
Keeps paved + low traffic · +6 mi detour
- Accept moderate traffic for 3 mi**
Keeps paved + mileage · one busier road

At the bottom of the panel, there is a link: 'Adjust constraints manually --'.

The durable, portable copy of the plan. The planner picks a file format for their device or service, chooses exactly what to include, and whether to split by day. Export works with no account — it is the guaranteed way to get a route out of the app.

KEY FUNCTIONS

- Formats: GPX (universal), TCX (Garmin), FIT (bike computers)
- Include: route, waypoints, cue sheet, optional saved variants
- One file, or one file per day
- Filename & size preview

Confirmation that the file wrote, with the exact filename and contents. From here the planner can reveal the file, push it to a connected service, copy a share link, or export another format.

KEY FUNCTIONS

- Clear success confirmation with file summary
- Reveal in the file system
- Send to a connected service (Garmin, Strava) or copy link
- Export another format without starting over

The same export on the phone in Outdoor Contrast: a format list with target-service hints, an includes checklist, and a large Download plus “Send to app” hand-off in the thumb zone.

KEY FUNCTIONS

- Format list with target-service hints
- Includes checklist
- Download + Send to app, thumb-reachable

A bottom sheet confirms the file saved and offers immediate hand-off to Garmin, Strava, the system share sheet, or Files — so the route reaches the rider's head unit in one step.

KEY FUNCTIONS

- Success confirmation with file summary
- Hand-off targets: Garmin, Strava, system share, Files

At the trailhead, the rider gives the whole tour one last look before clipping in. A whole-trip map, summary stats, day-by-day cards with elevation and weather, and an unmistakable offline-ready status — then a big Start ride action. Everything works with no signal.

KEY FUNCTIONS

- Whole-trip map + summary (distance, climbing, riders)
- Day cards with elevation, lodging, weather
- Offline-ready status; files confirmed on device
- Start ride pinned in the thumb zone

Day cue sheet (turn-by-turn)

Tapping a day opens its cue sheet — the maneuver-by-maneuver list with cumulative mileage, direction, road name and notes. Key moments like the water stop, the climb, and the group regroup point at the summit are called out.

KEY FUNCTIONS

- Maneuver list with cumulative mileage
- Climb segment banded for glanceability
- Waypoints (water, summit, regroup) highlighted
- Start ride from the day

In-ride navigation

On the handlebar, mid-ride. Everything shrinks to what matters at speed and in sunlight: a large next-maneuver banner, the live map with the route ahead, the upcoming water-stop waypoint with distance-to-go, a compact climb readout, and ride stats. High-contrast for legibility; controls sit in the thumb zone.

KEY FUNCTIONS

- Large next-turn banner + “then” preview
- Live map with thumb-zone controls
- Upcoming waypoint card (water stop) with distance
- Elevation/climb readout + ride stats; pause control

The honest on-the-ride dead-end. If the phone loses GPS, navigation degrades gracefully rather than failing: a clear “signal lost / searching” banner, the map frozen at the last known position, and — most importantly — the reassurance that the cue sheet still works, so the rider follows by mileage until signal returns.

KEY FUNCTIONS

- Clear signal-lost / searching banner
- Map frozen at last known position
- Cue sheet still works — follow by mileage
- Route stays loaded; no data lost
